combined heat & power on dairy farms

Crave Brothers Farm

633 kW Biogas CHP Application

Project Profile

Quick Facts

Location:
Waterloo, Wisconsin

Facility Type:
Dairy Farm and Cheese Factory

CHP Generating Capacity:
633 kW

Prime Mover Type:
GE Jenbacher JMC312

Heat Recovery Source:
Oil, Jacket, Intercooler, and Exhaust

Heat Recovery Rate:
2,530 Mbtu/hr of Hot Water

Fuel Type:
Digester Gas at ~55% Methane

CHP Efficiency:

- ▶ 38.1% Electric Efficiency
- ▶ 44.6% Thermal Efficiency
- ▶ 82.7% Overall Efficiency

CHP Installation Costs:
\$1.2 Million

CHP Annual Savings:
\$250,000 to \$300,000

CHP Simple Payback:
4-5 Years

Began Operation:
2009 (Phase II)

Project Overview

In April 2009, the Clear Horizons digestion system installed at the Crave Brothers Farm, located in Waterloo, Wisconsin, began the operation of an upgraded, 633 kilowatt combined heat and power (CHP) system operating on anaerobic digester gas from cow manure. At the core of the CHP system is a single GE Jenbacher JMC312 engine generator with exhaust heat recovery equipment. The electricity generated by the CHP system is sold directly to WE Energies. The recovered heat from the engine generator is used to maintain the temperature of the anaerobic digesters as well as provide heating and hot water for the farm's buildings. The total project cost of the CHP system was \$1.2 million with a projected simple payback of approximately 4 to 5 years.

Crave Brothers Farm

Background

An anaerobic digester was originally installed, owned, operated, and maintained at Crave Brothers Farm by Clear Horizons LLC, headquartered out of Milwaukee, Wisconsin beginning in 2007. It was installed to assist in the reduction of animal waste problems associated with manure disposal on farms, odor reduction, and the potential revenue benefit resulting from expanding the farm's milking operation, without the need of expanding land. Without more land to spread the increased manure on, the farm would not have been able to add to their existing herd. By partnering with Clear Horizons, the investment needed for more land or for the digester system could be used toward additional cattle and barns

In 2007, Clear Horizons completed the first phase of the two phase project consisting of one digester and a 230kW engine CHP system. This system processed manure from the farm's 750 Holstein cows as well as cheese whey from the adjoining cheese plant. Following early operations of the system, Clear Horizons realized they had more biogas to utilize than was initially anticipated. With the opportunity for expansion, Clear Horizons embarked on the second phase of the anaerobic digester project in 2009 as the farm increased their herd to 1,600 head of livestock and installing an additional anaerobic digester, thereby doubling the biogas output of the plant. The existing 230 kW engine was upgraded and replaced with a 633kW GE Jenbacher JMC312 engine generator set to accommodate the additional biogas production.

Continued on next page

Prior to the AD/CHP system installations, the waste produced on the farm was stored in an open lagoon. This system released harmful methane gas into the atmosphere. Today, the anaerobic digester prevents this release of harmful greenhouse gas emissions, equivalent to 7,125 tons of carbon dioxide annually.

The Waste-to-Energy Processes

Each day Crave Brothers Farm produces 50,000 gallons of animal waste from the livestock and whey from the cheese plant operations. All of this waste is pumped into the two, 750,000 gallon digester tanks, without any pretreatment. The waste is mixed and heated to 100°F to aid in the digestion process. From the digestion process, an anaerobic digester gas (biogas) is produced for use in the CHP genset, which produces clean electricity sold to the local utility.

By providing the utility with electricity generated from a clean, renewable resource, Clear Horizons and Crave Brothers Farm displace the fossil fuel used to generate electricity by the utility power plants, and therefore displace harmful greenhouse gas emissions. The electricity they produce is enough to power 550 Wisconsin homes annually.

The electric generation process produces heat that would be wasted if not for the heat recovery system included with system application. The recovered heat is purchased by Crave Brothers Farm from Clear Horizons to supplement the farm's hot water production as well as for heating the office, shop, special needs barn, parlor and nursery. The heat is also utilized by the digesters, to maintain the required operating temperature at 100°F.

Crave Brothers Farm/Clear Horizons Partnership

Crave Brothers Farm and Clear Horizons hold a 10 year contract for this partnership. Clear Horizons LLC installed, owns and operates the biogas-to-energy system located at Crave Brothers Farm. The anaerobic digester/ CHP system was paid for by Clear Horizons and they own the rights to the carbon credits and byproducts produced by the digesters, including the, solids and the generated electricity produced by the CHP system. Crave Brothers Farm buys back the solids for bedding, and the heat captured by the CHP heat recovery system to provide useful heat to the farm processes. The farm retains the liquid effluent for a nutrient rich land fertilizer. Clear Horizons sells the generated electricity to the local utility and sells a portion of the solids that is not utilized by Crave Brothers Farms as a potting mix to area landscapers.
